

Experiment 10

10.1.2 Reverse String

Algorithm :

- Step 1 :** Start
- Step 2 :** Input string and store in user_string
- Step 3 :** Set result as an empty string
- Step 4 :** Find length of user_string and store in l
- Step 5 :** Set $i = l - 1$
- Step 6 :** Repeat steps while i is greater than or equal to 0
- Step 7 :** Get the character at index i from user_string
- Step 8 :** Add the character to result
- Step 9 :** Decrease i by 1
- Step 10 :** Go back to Step 6
- Step 11 :** Print result
- Step 12 :** Stop

Flowchart :

```
def reverse_string(user_string): result=""
    l=len(user_string)
    for i in range (l-1,-1,-1):
        result += user_string[i]
    return result
user_input = input("Enter a string: ")
result=reverse_string(user_input)
print(f"Original String: {user_input}")
print(f"Reversed String: {result}")
```

10.1.2. Reverse a String

Write a Python program that prints the reverse of a given input string. The program uses a `reverse_string()` function that takes a string as input and returns its reversed string.

Input Format:

- The program prompts "Enter a string: " and reads a string representing the string to be reversed.

Output Format:

- The first line prints the original string, in the format:

Original String: <input_string>

- The next line prints the reversed string, in the format:

Reversed String: <reversed_string>

Sample Test Cases

ReverseS...

1 2 3 4 5 6 7 8 9 10

```
def reverse_string(user_string):
    result=""
    l=len(user_string)
    for i in range (l-1,-1,-1):
        result += user_string[i]
    return result
user_input = input("Enter a string: ")
result = reverse_string(user_input)
print(f"Original String: {user_input}")
print(f"Reversed String: {result}")
```

Debugger

Average time0.004 s4.50 ms

Maximum time0.006 s6.00 ms

2 out of 2 shown test case(s) passed

2 out of 2 hidden test case(s) passed

Test case 16 ms

Test case 26 ms
